Questions 4 and 5 are based on this passage.

African American soul music's commercial influence gradually declined during the early 1970s as newer styles such as funk and disco began to dominate the airwaves and other, larger changes occurred within the American music industry. After the Second World War, African American popular music had largely been the province of independent record labels. By the 1970s, though, these labels were either going out of business or, to an increasing degree, coming under the control of major corporations. This shift had dire consequences for the production of soul music: whereas independent labels had achieved success through a skillful balance of commercial and artistic considerations, the emphasis now became fixed upon marketing a product, resulting in the more individualized voices in African American popular music being quelled.

Which of the following does the passage suggest about the "shift" mentioned in the final sentence?

- ☐ It closed paths to musical expression for some African American musicians.
- ☐ It ushered in a period of increasing profitability for major corporations.
- ☐ It was largely caused by changing creative priorities within soul music.
- ☐ It prompted independent record labels to focus on funk and disco music.
- ☐ It was the culmination of a trend that began during the Second World War.

Questions 10 to 12 are based on this passage.

In 1886 approximately 20 percent of United States workers belonged to the Knights of Labor, a labor-activist fraternal order. Nonetheless, soon after reaching this peak, the Knights' membership began a rapid decline and the organization never regained its national prominence. This collapse had wide-ranging repercussions: subsequent worker organizations took a less active and less broad-based organizational approach. The Knights' defeat demoralized those who championed radical reform and the organization of workers as a class, while empowering those who promoted a less inclusive strategy.

Current scholarship has tended to attribute the Knights' calamitous decline to two factors: persistent tension between skilled and unskilled workers, and fierce opposition from employer associations, which used extralegal means to undermine unions. Voss examined both factors and found that employer associations' opposition, not conflict among the Knights, led to the Knights' rapid decline. But Voss' account fails to explain why the Knights succumbed so easily when other union movements thrived. It seems that the Knights' particular organizational structure prompted factional disputes among members and, more important, that competition from rival trade and fraternal organizations lured members away. While dissension within the order might not itself have sufficed to cause its demise, the profusion of organizational alternatives during this period induced mass defection, and, subsequently, the transformation of the American labor movement.

The author would be most likely to agree with which of the following statements about "Current scholarship" ?

- ☐ It underestimates the extent to which the American labor movement was affected by the decline in influence of the Knights of Labor.
- ☐ It tends to downplay the intensity of the tension between skilled and unskilled workers who belonged to the Knights of Labor.
- ☐ It offers a more accurate view of the factors that led to the decline of the Knights of Labor than was offered in earlier scholarship.
- ☐ It tends to characterize the organizational structure of the Knights of Labor in ways that obscure its effect on the organization's decline.
- ☐ It fails to identify a key factor that accounts for the decline in membership of the Knights of Labor.

All numbers used are real numbers.

All figures are assumed to lie in a plane unless otherwise indicated.

Geometric figures, such as lines, circles, triangles, and quadrilaterals, **are not necessarily** drawn to scale. That is, you should **not** assume that quantities such as lengths and angle measures are as they appear in a figure. You should assume, however, that lines shown as straight are actually straight, points on a line are in the order shown, and more generally, all geometric objects are in the relative positions shown. For questions with geometric figures, you should base your answers on geometric reasoning, not on estimating or comparing quantities by sight or by measurement.

Coordinate systems, such as xy -planes and number lines, **are** drawn to scale; therefore you can read, estimate, or compare quantities in such figures by sight or by measurement.

Graphical data presentations, such as bar graphs, circle graphs, and line graphs, **are** drawn to scale; therefore, you can read, estimate, or compare data values by sight or by measurement.

Questions 5 and 6 are based on this passage.

In 1755 British writer Samuel Johnson published an acerbic letter to Lord Chesterfield rebuking his patron for neglect and declining further support. Johnson's rejection of his patron's belated assistance has often been identified as a key moment in the history of publishing, marking the end of the culture of patronage. However, patronage had been in decline for 50 years, yet would survive, in attenuated form, for another 50. Indeed, Johnson was in 1762 awarded a pension by the Crown—a subtle form of sponsorship, tantamount to state patronage. The importance of Johnson's letter is not so much historical as emotional; it would become a touchstone for all who repudiated patrons and for all who embraced the laws of the marketplace.

Consider each of the choices separately and select all that apply.

The author of the passage mentions Johnson's 1762 pension award in order to

- ☐ provide a specific example of patronage's surviving into the second half of the eighteenth century
- ☐ emphasize that patronage still helped support Johnson's writing after his letter to Chesterfield
- ☐ provide evidence for a general trend in the later half of the eighteenth century of private patronage's being replaced by state sponsorship

Questions 7 to 9 are based on this passage.

Until the mid-1980s, Swedish workers' wages were largely determined through centralized collective bargaining at a national level, a policy aimed at achieving equal pay for equal work across companies and industries. This policy, designed to raise the relative wages of low-wage workers, resulted in a decrease in overall wage inequality in Sweden's labor market. Furthermore, this policy may have indirectly resulted in a relatively small gender wage gap (difference between women's wages and those of similarly qualified men): several recent studies have demonstrated that decentralized wage bargaining produces relatively large wage inequality in general and large gender wage differentials in particular, and international comparisons show that a society's overall wage inequality is positively related to the gender wage gap.

Therefore, in designing a study of organizational factors that perpetuate inequities in women's wages, researchers decided to gather data on the current situation in Swedish companies. The researchers reasoned that the occurrence of discriminatory wage-setting practices in Swedish companies could provide a conservative estimate of the prevalence of such practices in other developed countries. Despite increasing decentralization of Sweden's wage-bargaining process since the mid-1980s, they reasoned, the effects of the earlier policy on current wages should still be evident to some extent.

It can be inferred that the highlighted "studies" lend support to which of the following statements about women workers' wages?

- ☐ In most countries, women workers' wages would not likely be affected by centralized collective bargaining in the same way as they were in Sweden prior to the mid-1980s.
- ☐ In most countries, women workers' wages are closer to the wages of similarly qualified men than they are in Sweden.
- ☐ Women workers' wages are generally less affected by centralized collective bargaining than are men's wages.
- ☐ Women workers' wages are sometimes adversely affected by wage-setting practices that are intended to remedy overall wage inequality.
- ☐ Women workers' wages are generally closer to the wages of similarly qualified male workers where wages are set through centralized wage bargaining than where they are set through decentralized bargaining.

Until the mid-1980s, Swedish workers' wages were largely determined through centralized collective bargaining at a national level, a policy aimed at achieving equal pay for equal work across companies and industries. This policy, designed to raise the relative wages of low-wage workers, resulted in a decrease in overall wage inequality in Sweden's labor market. Furthermore, this policy may have indirectly resulted in a relatively small gender wage gap (difference between women's wages and those of similarly qualified men): several recent studies have demonstrated that decentralized wage bargaining produces relatively large wage inequality in general and large gender wage differentials in particular, and international comparisons show that a society's overall wage inequality is positively related to the gender wage gap.

Therefore, in designing a study of organizational factors that perpetuate inequities in women's wages, researchers decided to gather data on the current situation in Swedish companies. The researchers reasoned that the occurrence of discriminatory wage-setting practices in Swedish companies could provide a conservative estimate of the prevalence of such practices in other developed countries. Despite increasing decentralization of Sweden's wage-bargaining process since the mid-1980s, they reasoned, the effects of the earlier policy on current wages should still be evident to some extent.

The author of the passage attributes the highlighted "decrease" to which of the following?

- ☐ A decline in Sweden's gender wage gap
- ☐ A decline in low-wage workers' wages in Sweden
- ☐ A decline in women's wages in Sweden
- ☐ A policy governing wage bargaining in Sweden
- ☐ A change in Sweden's wage-bargaining practices initiated in the mid-1980s

Questions 7 to 9 are based on this passage.

Until the mid-1980s, Swedish workers' wages were largely determined through centralized collective bargaining at a national level, a policy aimed at achieving equal pay for equal work across companies and industries. This policy, designed to raise the relative wages of low-wage workers, resulted in a decrease in overall wage inequality in Sweden's labor market. Furthermore, this policy may have indirectly resulted in a relatively small gender wage gap (difference between women's wages and those of similarly qualified men): several recent studies have demonstrated that decentralized wage bargaining produces relatively large wage inequality in general and large gender wage differentials in particular, and international comparisons show that a society's overall wage inequality is positively related to the gender wage gap.

The passage suggests which of the following about the highlighted "policy" ?

- ☐ It was abandoned in the mid-1980s because it was no longer considered effective.
- ☐ Its effect on Sweden's labor market has been debated in several recent studies.
- ☐ Its effect on Sweden's labor market was consistent with the intentions that led to its adoption.
- ☐ It produced an indirect result that ran counter to a widespread assumption about the effect of centralized collective bargaining on wages.
- ☐ It was modeled on policies that had been adopted in several other developed countries.

Question 13 is based on this passage.

Occupational health experts hypothesize that the greater the control a worker has over his or her work routine, the less likely that worker is to suffer an on-the-job injury. Clearly, this hypothesis is supported by the results of a survey that show that workers with little discretion in how they do their jobs take time off for back injuries twice as often as those who do similar work but have more control over their work routines.

Which of the following, if true, most seriously undermines the support for the hypothesis provided by the survey results?

- ☐ Workers who feel that they have adequate control over the way they do their work are more willing than others to put up with physical discomfort while at work.
- ☐ Workers who are looking for a new job and have previously suffered an injury on the job tend to choose one in which they will have a high degree of control over their work routines.
- ☐ Workers with control over their work routines are no more likely than other workers to know which practices are most likely to cause back injuries.
- ☐ Workers who can change tasks or techniques when they begin to experience strain are able to prevent many injuries from occurring.
- ☐ Clerical workers tend to have more discretion in how they do their jobs than manufacturing workers, who report more back injuries per capita than clerical workers.

Questions 14 and 15 are based on this passage.

Fearing the development of antibiotic-resistant bacteria, many United States health, consumer, and environmental organizations advocate ending the routine use of antibiotics as food additives in animal agriculture. According to one expert, "There is solid consensus among medical and public health officials that the profligate use of antibiotics in both human medicine and animal agriculture is eroding the efficacy of our arsenal of antibiotics." This consensus, however, has been challenged. Some studies have found no reduction in antibiotic resistance in humans following the European Union's 2003 ban on the use of antibiotics as growth promoters in animal feed (antibiotics can still be used to treat sick animals), while others have reported a greater increase in food-borne diseases among Europeans following the ban.

The passage implies which of the following about the European Union's ban?

- ☐ It might have been more effective in achieving its stated objective if it had been implemented more consistently throughout the European Union.
- ☐ It would have been less likely to affect rates of food-borne diseases among Europeans if it had prohibited all agricultural uses of antibiotics.
- ☐ It provided a model for a policy that was subsequently proposed by public health officials in the United States.
- ☐ It established a policy that would likely be embraced by organizations mentioned earlier in the passage.
- ☐ It was initiated by organizations that routinely questioned the reasoning behind a consensus mentioned earlier in the passage.

If a question has answer choices with **ovals** , then the correct answer consists of a single choice. If a question has answer choices with **square boxes** , then the correct answer consists of one or more answer choices. Read the directions for each question carefully. The directions will indicate if you should select one or more answer choices. To answer questions based on a data presentation, you may need to scroll or use your keyboard to access the entire presentation.

All numbers used are real numbers.

All figures are assumed to lie in a plane unless otherwise indicated.

Geometric figures, such as lines, circles, triangles, and quadrilaterals, **are not necessarily** drawn to scale. That is, you should **not** assume that quantities such as lengths and angle measures are as they appear in a figure. You should assume, however, that lines shown as straight are actually straight, points on a line are in the order shown, and more generally, all geometric objects are in the relative positions shown. For questions with geometric figures, you should base your answers on geometric reasoning, not on estimating or comparing quantities by sight or by measurement.

Coordinate systems, such as xy -planes and number lines, **are** drawn to scale; therefore you can read, estimate, or compare quantities in such figures by sight or by measurement.

Graphical data presentations, such as bar graphs, circle graphs, and line graphs, **are** drawn to scale; therefore, you can read, estimate, or compare data values by sight or by measurement.
